

INOVONICS WIRELESS TRANSMITTERS/RECEIVERS INTEGRATION WITH C·CURE 9000

Inovonics wireless alarm transmitters/receivers allow users to activate alarms using panic buttons or other wireless sensors, and the integration with C·CURE 9000 lets security personnel manage those alarms from one single user interface.

- Add a layer of protection with Inovonics' wireless solutions
- Reduces installation time and costs of trenching
- All events managed in C·CURE user interface
- Real time annunciation of alarms for faster response times
- All activity logged in C·CURE journal

Manage All Mission-Critical Alarms

Sometimes, the places that need the most vigilant security are the hardest to secure. Parking garages, construction sites, VIP suites, private entrances, etc. can present significant challenges because of the nature of their separation from main building structures.

Inovonics transmitters and receivers provide an extra layer of security in hard-to-wire environments, and can save thousands of dollars in installation costs. The integration developed by New Market Solutions allows security personnel to manage all alarms generated by Inovonics devices through the C·CURE 9000 interface.

Comprehensive Reporting

All Inovonics events are reported in the C·CURE journal like any other hardware, giving operators a one-stop place to review important information related to alarms or events to quickly mitigate any security concerns.

The integrated C·CURE/ Inovonics Solution is an excellent way to implement a cost-effective security solution that satisfies the strict security demands of government, healthcare, and commercial customers.
